

Harvestmen fauna of Gümüşhane and Bayburt in Turkey

(Arachnida, Opiliones)

Kemal Kurt & Ömer Köksal Erman

Kurt, K. & Erman, Ö. K. 2015. Harvestmen fauna of Gümüşhane and Bayburt in Turkey (Arachnida, Opiliones). *Spixiana* 38(1): 29–38.

In this study, all samples were collected from Turkey (Gümüşhane and Bayburt provinces) between June 2010 and October 2012. They were evaluated systematically. As a result of these evaluations, 20 species in 14 genera belonging to 4 families were determined. One of them, *Rilaena triangularis* (Herbst, 1799), is recorded for the first time from Turkey. GPS data of each collecting site, and distribution in Turkey and all over the world of these species are presented in the text.

Introduction

Harvestmen is the third largest order of the Arachnida classis after mites and spiders. Up to now, in total 310 species in Europe, 801 in the palaearctic region and 6456 species in the world have been determined (Mitov 2007, Kury 2012). Only 100 species and one subspecies of harvestmen have been recorded from Turkey (Mitov 2012).

The research area, Gümüşhane province and Bayburt province (Fig. 1), is located in the north-east of Turkey. Gümüşhane is situated in the east of Bayburt, west of Giresun, north of Trabzon and south of Erzincan, 38°45'–40°12' east longitude and 39°45'–40°50' north latitude. The district covers 6575 km² and lies at an elevation of 1210 m above sea level. Climate of Gümüşhane is represented as a transition between Eastern Anatolia and the Black Sea. While Zigana Mountain prevents dominance of Black Sea climate, Kop Mountain prevents dominance of continental climate. Bayburt is situated in the east of Erzurum, west of Gümüşhane, north of Trabzon and Rize, south of Erzincan, 40°37' north latitude and 40°45' east longitude, 39°52' south latitude and 39°37' west longitude. It covers 3739 km² and lies at an average elevation of 1550 m above sea level. Bayburt climate,

defined as a transition between the Eastern Black Sea and Eastern Anatolia, has predominant features of continental climate. For this reason, the summers are hot and dry, while winters are cold and rainy.

In this study, totally 20 species belonging to 14 genera of the families Dicranolasmatidae, Nemasomatidae, Phalangiidae and Trogludidae have been recorded from Gümüşhane and Bayburt provinces of Turkey. The aim of this study is to make a contribution to the Turkish harvestmen fauna.

Materials and methods

This study was carried out between 2010 and 2012 in the provinces of Gümüşhane and Bayburt in Turkey. Samples were collected by hand (with tweezers and aspirator) and pitfall traps on soil, under stone, and under bark. The specimens were examined under a Leica EZ4 stereomicroscope and the keys of Martens (1978, 2006), Chevrizov (1979), Gruber (1998), Hillyard & Sankey (1990) and Chemeris & Kovblyuk (2005) were used for their identification. Examined specimens were preserved in 70 % ethanol and deposited in the collection of the Arachnological Laboratory of Şiran Vocational School, Gümüşhane University (GUSAL).

center), GŞİ (Gümüşhane, Şiran district), GKE (Gümüşhane, Kelkit district), GTO (Gümüşhane, Torul district), GKÜ (Gümüşhane, Kürtün district), GKÖ (Gümüşhane, Köse district), BME (Bayburt, center), BAY (Bayburt, Aydıntepe district), BDE (Bayburt, Demirözü district).

The coding system is shown in “Material examined”. In this coding system, first capital letter represents the provinces, other capital letters represent the locality and for the collection date numbers are used.

Results and discussion

In this study, we determined and listed the harvestmen fauna of Gümüşhane and Bayburt in Turkey. A total of 1689 individuals were collected from the research area. 379 adult males, 935 adult females and 375 nymphs were examined. As a result 1117 specimens in Phalangidae, 186 specimens in Nemasomatidae, 7 specimens in Dicranolasmatidae and 4 specimens in Trogulidae were found. Totally, 20 species belonging to 14 genera in the families Dicranolasmatidae, Nemasomatidae, Phalangidae and Trogulidae are recorded in the research area. One of them, *Rilaena triangularis* (Herbst, 1799), is recorded for the first time in Turkey. Recording of these species from Gümüşhane and Bayburt province widens their distribution to Turkey. We suggest that advanced search will increase numbers of the Turkish harvestmen in the future.
